

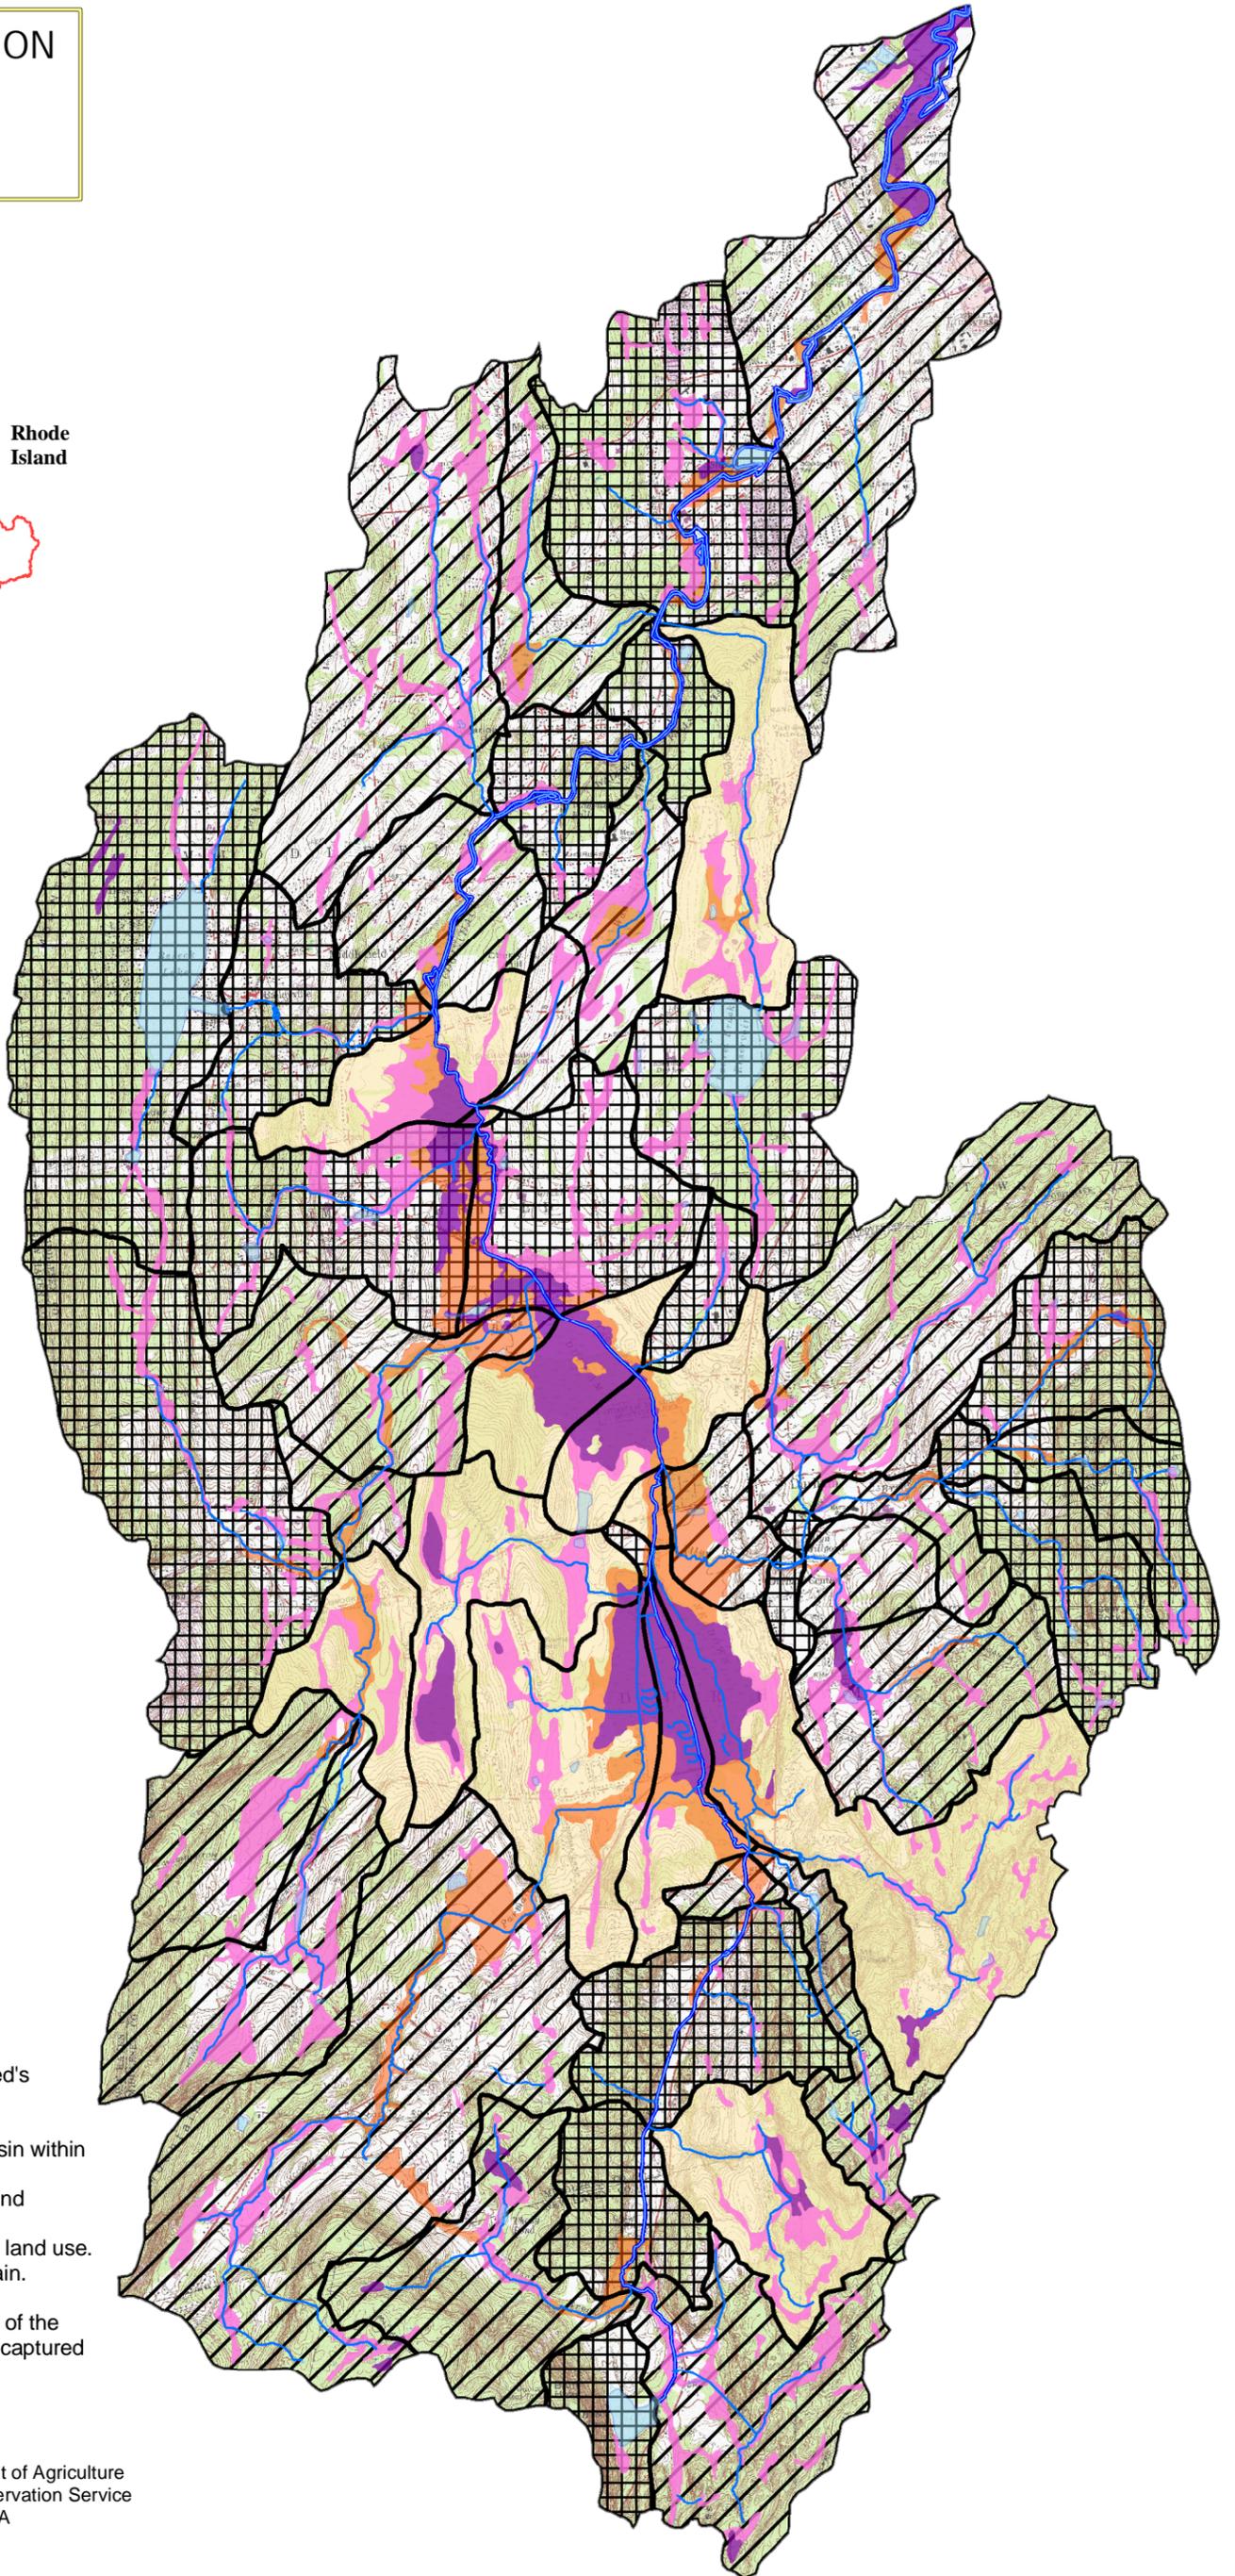

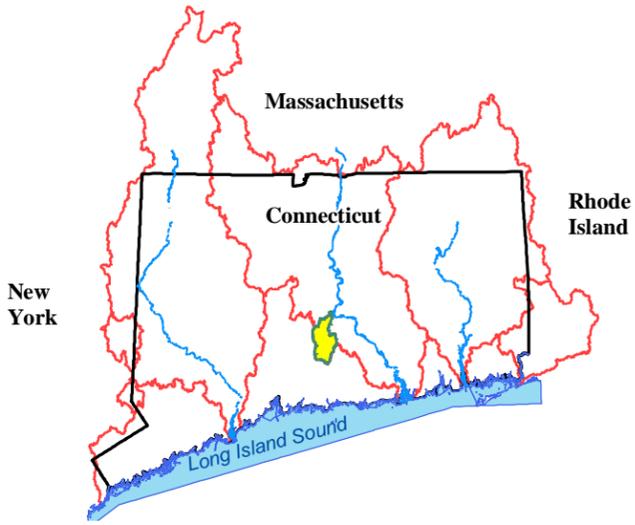

**MAP 10: WETLAND EVALUATION
CAPACITY RATING
Coginchaug River Watershed**

Wetland Capacity Rating

Capacity Rating

- High
- Moderate
- Low

CT Inland Wetland Soils

- Poorly Drained Soils
- Very Poorly Drained Soils
- Non-Hydric Alluvial / Floodplain Soils

Basin Boundaries

- Local Basin Boundaries

Perennial Water

- Coginchaug River
- Other Streams

Four factors were considered when evaluating the watershed's wetland capacity:

1. The size of the wetland as a percentage of the local basin within which it is located.
2. The percent of very poorly drained soils, open water, and standing water in the wetland.
3. The amount of degradation in the watershed related to land use.
4. The percent of wetland located in a non-hydric floodplain.

The actual location of the wetland soils and the connectivity of the wetlands to the perennial water system was not completely captured in this analysis.
